## How to Push the code to GitHub

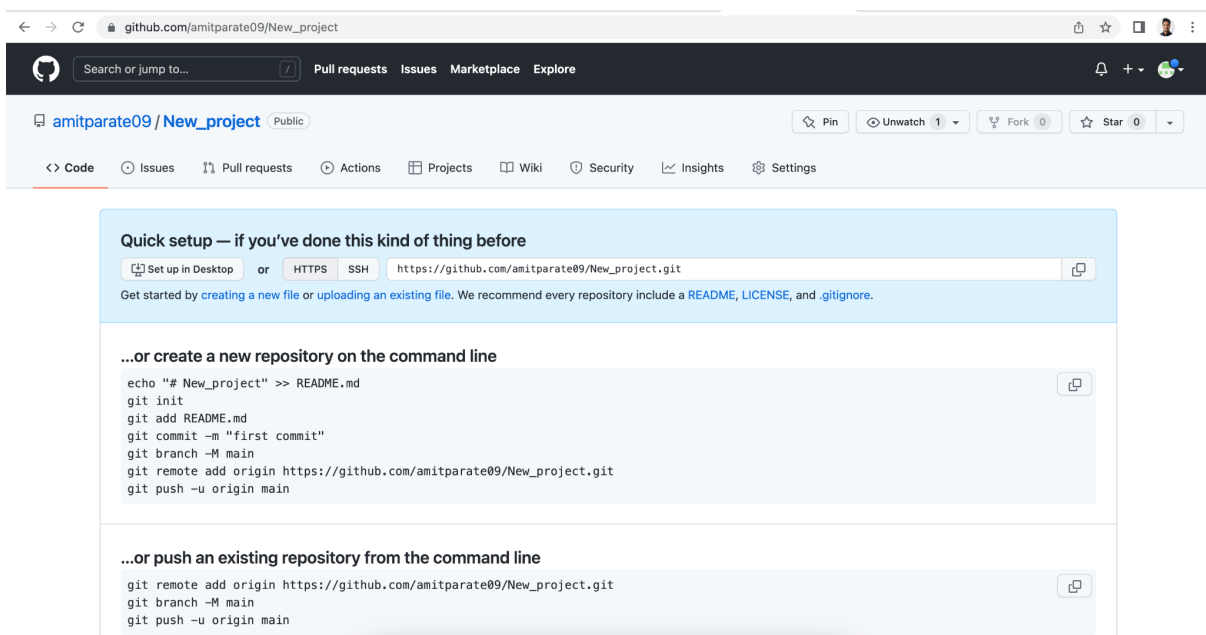

=====

To push the code to the Git repository we required some prerequisite for that

- Download the git from the link <https://git-scm.com/download/win>
- Install the git into your computer follow the linked video [https://youtu.be/BMW7LiF\\_Oc4](https://youtu.be/BMW7LiF_Oc4)
- After installation completion we need to navigate to the project repository where we are storing the code.
- After navigating to the folder right click inside the folder then we got 2 options 1. Git GUI Here and 2. Git Bash Here
- Click on Git Bash Here
- After that we need to create two repository
  - Local Repository (git repository)
  - Remote Repository (github repository)

- **To create local repository** and initialise for the first time run a command inside git bash
  - **git init** > initialise empty git repository (local repository)
- **To create remote repository**
  - Go to the site <https://github.com/>
  - Create an account in github
  - Sign in to the account
  - Click on create repository button
  - Enter the repository name
  - Click on create repository

- Associate the local repository to remote repository, for that run a command
  - **git remote add origin** "<https://github.com/amitparate09/BankingProject.git>"
- After this command the connection is established
- Now check the status of the files
  - **git status** > what are files to commit in git repository.
- Add all the files into staging area
  - **git add -A** >> add all your files to staging area
- Now from staging area send those files to git repository
- For the first time we need to configure the username and email to the git repository
  - **git config --global user.name** "amitparate09"
  - **git config --global user.email** "[amit.parate09@gmail.com](mailto:amit.parate09@gmail.com)"

- Now commit to your repository
  - `git commit -m "first commit"`
- And check the status
  - `git push -u origin master >> commit all the files into git repository`
